## **DETAILED ACTION**

### ***Claim Objections***

Claims 1-3 are objected to because of the following informalities: It seems claim 1 is referring to Applicant's embodiment as shown in fig. 3. It is not clear where the slit and the planar waveguide on a substrate located. It is also not clear whether the waveguide 91 and substrate 92 are part of the insertion plate or part of the substrate having a slit. Appropriate correction is required. Note that no new matter can be added in the original specification.

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

**Claims 1-3 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by Haeberle et al [USPAT 6,628,452].**

Haeberle et al disclose an optical device comprising at least one slit 140 [fig. 4] on a planar optical waveguide 21 formed on a substrate, flat insertion plate holding

Art Unit: 2874

means 130 for holding the insertion plate 120, said insertion plate holding means having electric wiring 210 [fig. 6]; and

A flat magnet [inherent] placed in a manner that the magnet faces a surface of the insertion plate holding means opposite to a surface facing the optical waveguide, wherein

Lorentz force caused by interaction between current flowing through the electric wiring and magnetic field generated by the magnet displaces the insertion plate holding means to drive the insertion plate.

Note that once there is electric current flowing through the insertion plate 120, the plate is functioning as a magnet.

Note further that the Lorentz force is inherently occurred in the Haeberle et al device once there is magnetic field generated by the electric current flowing.
